Contents:

INTRODUCTION

dfnWorks is a parallelized computational suite to generate three-dimensional discrete fracture networks (DFN) and simulate flow and transport. Developed at Los Alamos National Laboratory, it has been used to study flow and transport in fractured media at scales ranging from millimeters to kilometers. The networks are created and meshed using dfnGen, which combines FRAM (the feature rejection algorithm for meshing) methodology to stochastically generate three-dimensional DFNs with the LaGriT meshing toolbox to create a high-quality computational mesh representation. The representation produces a conforming Delaunay triangulation suitable for high performance computing finite volume solvers in an intrinsically parallel fashion. Flow through the network is simulated with dfnFlow, which utilizes the massively parallel subsurface flow and reactive transport finite volume code PFLOTTRAN. A Lagrangian approach to simulating transport through the DFN is adopted within dfnTrans to determine pathlines and solute transport through the DFN. Applications of the dfnWorks suite include nuclear waste repository science, hydraulic fracturing and CO₂ sequestration.

To run a workflow using the dfnWorks suite, the pydfnworks package is highly recommended. pydfnworks calls various tools in the dfnWorks suite with the aim to provide a seamless workflow for scientific applications of dfnWorks.

1.1 Citing dfnWorks

Hyman, J. D., Karra, S., Makedonska, N., Gable, C. W., Painter, S. L., & Viswanathan, H. S. (2015). dfnWorks: A discrete fracture network framework for modeling subsurface flow and transport. *Computers & Geosciences*, 84, 10-19.

  publisher={Elsevier}
}
```

1.2 What's new in v2.0?

- New dfnGen C++ code which is much faster than the Mathematica dfnGen. This code has successfully generated networks with 350,000+ fractures.

- Increased functionality in the pydfnworks package for more streamlined workflow from dfnGen through visualization.

1.3 Where can one get dfnWorks?

dfnWorks 2.0 can be downloaded from <https://github.com/dfnWorks/dfnWorks-Version2.0>

v1.0 can be downloaded from <https://github.com/dfnWorks/dfnWorks-Version1.0>

1.4 Installation

Tools that you will need to run the dfnWorks work flow are described in this section. VisIt and ParaView, which enable visualization of desired quantities on the DFNs, are optional, but at least one of them is highly recommended for visualization. CMake is also optional but allows faster IO processing using C++.

1.4.1 Python

pydfnworks is supported on Python 2.7. The software authors recommend using the Anaconda 2.7 distribution of Python, available at <https://www.continuum.io/>. pydfnworks requires the numpy and h5py modules to be installed.

1.4.2 pydfnworks

The source for pydfnworks can be found in the dfnWorks suite, in the folder pydfnworks.

1.4.3 dfnGen

dfnGen primarily involves two steps: FRAM (the feature rejection algorithm for meshing) and LaGriT, the meshing tool box used to create a conforming Delaunay triangulation of the network.

FRAM

FRAM (the feature rejection algorithm for meshing) is executed using the dfnGen C++ source code, contained in the dfnGen folder of the dfnWorks repository.

LaGriT

The LaGriT meshing toolbox is used to create a high resolution computational mesh representation of the DFN in parallel. An algorithm for conforming Delaunay triangulation is implemented so that fracture intersections are coincident with triangle edges in the mesh and Voronoi control volumes are suitable for finite volume flow solvers such as FEHM and PFLOTRAN.

1.4.4 dfnFlow

You will need one of either PFLOTRAN or FEHM to solve for flow using the mesh files from LaGriT.

PFLOTRAN

PFLOTRAN is a massively parallel subsurface flow and reactive transport code. PFLOTRAN solves a system of partial differential equations for multiphase, multicomponent and multiscale reactive flow and transport in porous media. The code is designed to run on leadership-class supercomputers as well as workstations and laptops.

FEHM

FEHM is a subsurface multiphase flow code developed at Los Alamos National Laboratory.

1.4.5 dfnTrans

dfnTrans is a method for resolving solute transport using control volume flow solutions obtained from dfnFlow on the unstructured mesh generated using dfnGen. We adopt a Lagrangian approach and represent a non-reactive conservative solute as a collection of indivisible passive tracer particles.

1.4.6 CMake

CMake is an open-source, cross-platform family of tools designed to build, test and package software. It is needed to use C++ for processing files at a bottleneck IO step of dfnWorks. Using C++ for this file processing optional but can greatly increase the speed of dfnWorks for large fracture networks. Details on how to use C++ for file processing are in the scripts section of this documentation.

1.4.7 VisIt

VisIt is a parallel, open-source visualisation software. PFLOTRAN can output in `.xmf` and `.vtk` format. These can be imported in VisIt for visualization.

Instructions for downloading and installing **VisIt** can be found at <https://wci.llnl.gov/codes/visit/download.html>

1.4.8 Paraview

Paraview is a parallel, open-source visualisation software. PFLOTRAN can output in `.xmf` and `.vtk` format. These can be imported in Paraview for visualization.

Instructions for downloading and installing **Paraview** can be found at <http://www.paraview.org/download/>

1.5 Using pydfnworks in your Python scripts

To access the functionality of pydfnworks, the user must include the following line at the top of any Python script

```
import pydfnworks
```

Before doing this, one needs to ensure that the pydfnworks directory is in the PYTHONPATH. This can be done by configuring `cshrc` or `bashrc` files. Alternatively, one can add the pydfnworks path using `sys.path.append()` in their driver script.

1.6 About this manual

This manual comprises of information on setting up inputs to dfnGen, dfnTrans and PFLOTTRAN, as well as details on the pydfnworks module: *pydfnworks*. Finally, the manual contains a short tutorial with prepared examples that can be found in the `tests` directory of the dfnWorks repository, and a description of some applications of the dfnWorks suite.

1.7 Contributors

- Jeffrey Hyman
- Satish Karra
- Nataliia Makedonska
- Nathaniel Knapp
- Carl Gable
- Hari Viswanathan
- Quan Bui (now at University of Maryland)
- Jeremy Harrod (now at Spectra Logic)
- Scott Painter (now at ORNL)

1.8 Contact

For any questions about dfnWorks, please email dfnWorks@lanl.gov.

2.1 Keywords

The following is an example input file with all keywords and explanation of each keyword.

```
/*=====*/
/*  General Options & Fracture Network Parameters:  */
/*=====*/

stopCondition: 0
/* 0: Stop once nPoly fractures are accepted (Defined below)
   1: Stop once all family's p32 values are equal or greater than the
       families target p32 values (defined in stochastic family sections)
*/

nPoly: 400
/* Used when stopCondition = 0 (nPoly option).

   The total number of fractures you would
   like to have in the DFN.
*/

domainSize: {10,10,10}
/* Mandatory Parameter.
   Creates a domain with dimension x*y*z centered at the origin.
*/

numOfLayers: 2
// Number of layers

layers:
{-25,0}
{0,25}
/* Layers need to be listed line by line
   Format: {minZ, maxZ}

   The first layer listed is layer 1, the second is layer 2, etc
   Stochastic families can be assigned to theses layers (see stochastic
   shape family section)
*/

h: .1
/* Minimum fracture length scale(meters).
   Any fracture with a feature, such as an intersection,
```

```
    of less than h will be rejected.
*/

radiiListIncrease: 0.05
/* Percent to increase the size of the pre-generated radii lists, per family.
   Example: 0.2 will increase the size of the list by %20.

   Lists are pre-generated and are used to insert fractures from largest to
   smallest in order to help hit target distributions.

   If the accepted+rejected count of fractures is much different than the
   estimated number of fractures needed with the percentage extra added in,
   you will not get your expected distribution.
*/

removeFracturesLessThan: 0
/*
   Options:
       0 - Ignore this option, keep all fractures.

       Size of minimum fracture radius. Fractures smaller than
       defined radius will be removed AFTER DFN generation.

       Minimum and maximum size options under fracture family
       distributions will still be used while generating the DFN.
*/

/*=====*/
/* File Output Options: */
/*=====*/

/* An output file (radii.dat) is always generated and contains all radii of
   fractures in the domain (before and after truncation).
*/

outputAllRadii: 0
/* Caution: Can create very large files.
   Outputs all fractures which were generated during
   DFN generation (Accepted + Rejected).
       0: Do not output all radii file.
       1: Include file of all raddii, accepted + rejected fractures,
          in output files (radii_All.dat).
*/

outputFinalRadiiPerFamily: 1
/* Outputs radii files after isolated fracture removal.
   One file per family.
       0: Do not create output files of radii per family
       1: Creates output files per family, containing a list
          of the family's fracture radii that is in the final DFN
*/
```

```

outputAcceptedRadiiPerFamily: 1
/* Outputs radii files before isolated fracture removal.
   One file per family.
   0: Do not create output files of radii per family
   1: Creates output files per family, containing a list
      of the family's fracture radii in the domain before isolated
      fracture removal.
*/

/*=====*/
/* Fracture Network Parameters: */
/*=====*/

tripleIntersections: 1
/* Accept or reject triple intersections
   0 - Off (Reject)
   1 - On (Accept)
*/

forceLargeFractures: 1
/* Inserts the largest possible fracture for each defined fracture family,
   defined by the user-defined maxium radius
   0 - Off (Do not force insertion of larest fractures)
   1 - On (Force insertion of largest fractures)
*/

printRejectReasons: 0
/* Useful for debugging,
   This option will print all fracture rejection reasons as they occur.
   0 - Disable
   1 - Print all rejection reasons to screen
*/

disableFram: 0
/* This option disables the FRAM algorithm. There will be no
   fracture rejections or fine mesh. Defaults visualizationMode to 1.
   0 - Enable FRAM
   1 - Disable FRAM
*/

visualizationMode: 0
/* Used during meshing:
   0 - Creates a fine mesh, according to h parameter;
   1 - Produce only first round of triangulations. In this case no
      modeling of flow and transport is possible.
*/

seed: 0
/* Seed for random generator.
   Enter 0 for time based seed.
*/

domainSizeIncrease: {0,0,0}
/* Size increase for inserting fracture centers outside the domain.

```

```

    Fracture will be truncated based on domainSize above.
    Increases the entire width by this ammount. So, {1,1,1} will increase
    the domain by adding .5 to the +x, and subbtracting .5 to the -x, etc
*/

keepOnlyLargestCluster: 0
/* 0 - Keep any clusters which connects the specified
    boundary faces in boundaryFaces option below
    1 - Keep only the largest cluster which connects
    the specified boundary faces in boundaryFaces option below.

    If ignoreBoundaryFaces is also set to 1, dfnGen will keep the largest
    cluster which connects at least any two sides of the domain.
*/

ignoreBoundaryFaces: 1
/*
    0 - Use boundaryFaces option below
    1 - Ignore boundaryFaces option and keep all clusters,
    and remove fractures with no intersections
*/

boundaryFaces: {1,1,1,1,1,1}
/* DFN will only keep clusters with connections to
    domain boundaries which are set to 1:

    boundaryFaces[0] = +X domain boundary
    boundaryFaces[1] = -X domain boundary
    boundaryFaces[2] = +Y domain boundary
    boundaryFaces[3] = -Y domain boundary
    boundaryFaces[4] = +Z domain boundary
    boundaryFaces[5] = -Z domain boundary

    Be sure to set ignoreBoundaryFaces to 0 when
    using this feature.
*/

rejectsPerFracture: 350
/* If a fracture is rejected, it will be re-translated
    to a new position this number of times.

    This helps hit distribution targets for stochastic families
    families (Set to 1 to ignore this feature)
*/

insertUserRectanglesFirst: 1
/* 0 - User ellipses will be inserted first
    1 - User rectangles will be inserted first
*/

/*=====*/
/* Probability Parameters */
/*=====*/

famProb: {.33,.33,.34}
/* Each element is the probability of chosing a fracture from
    the element's corresponding family to be inserted into the DFN.

```

```

The famProb elements should add up to 1.0 (for %100).
The probabilities are listed in order of families starting with all
stochastic ellipses, and then all stochastic rectangles.

For example:
If then there are two ellipse families, each with probabiliy .3,
and two rectangle families, each with probabiliy .2, famProb will be:
famProb: {.3,.3,.2,.2}, famProb elements must add to 1
*/

/*=====*/
/*=====*/
/*                                     */
/* Elliptical Fracture Options          */
/* NOTE: Number of elements must match number of ellipse families          */
/*                                     */
/*=====*/
/*=====*/

nFamEll: 0
/* Number of ellipse families defined below.
   Having this option = 0 will ignore all rectangle family variables.
*/

eLayer: {0,0}
/* Defines which domain, or layer, the family belongs to.
   Layer 0 is the entire domain ('domainSize').
   Layers numbered > 0 coorespond to layers defined above (see 'Layers:').
   1 corresponst to the first layer listed, 2 is the next layer listed, etc
*/

edistr: {2,3}

```

DFNFLOW

dfnFlow involves using flow solver such as PFLOTTRAN or FEHM. PFLOTTRAN is recommended if a large number of fractures ($> O(1000)$) are involved in a network. Using the function calls that are part of *pydfnworks*, one can create the mesh files needed to run PFLOTTRAN. This will involve creating unstructured mesh file **uge* as well as the boundary **ex* files. Please see the PFLOTTRAN user manual at <http://www.pfлотran.org> under unstructured *explicit* format usage for further details. An example input file for PFLOTTRAN is provided in the repository. Please use this as a starting point to build your input deck.

Below is a sample input file. Refer to the PFLOTTRAN user manual at <http://www.pfлотran.org> for input parameter descriptions.

DFNTRANS

dfnTrans is a method for resolving solute transport using control volume flow solutions obtained from dfnFlow on the unstructured mesh generated using dfnGen. We adopt a Lagrangian approach and represent a non-reactive conservative solute as a collection of indivisible passive tracer particles. Particle tracking methods (a) provide a wealth of information about the local flow field, (b) do not suffer from numerical dispersion, which is inherent in the discretizations of advection–dispersion equations, and (c) allow for the computation of each particle trajectory to be performed in an intrinsically parallel fashion if particles are not allowed to interact with one another or the fracture network. However, particle tracking on a DFN poses unique challenges that arise from (a) the quality of the flow solution, (b) the unstructured mesh representation of the DFN, and (c) the physical phenomena of interest. The flow solutions obtained from dfnFlow are locally mass conserving, so the particle tracking method does not suffer from the problems inherent in using Galerkin finite element codes.

dfnTrans starts from reconstruction of local velocity field: Darcy fluxes obtained using dfnFlow are used to reconstruct the local velocity field, which is used for particle tracking on the DFN. Then, Lagrangian transport simulation is used to determine pathlines through the network and simulate transport. It is important to note that dfnTrans itself only solves for advective transport, but effects of longitudinal dispersion and matrix diffusion, sorption, and other retention processes are easily incorporated by post-processing particle trajectories. The detailed description of dfnTrans algorithm and implemented methodology is in Makedonska, N., Painter, S. L., Bui, Q. M., Gable, C. W., & Karra, S. (2015). Particle tracking approach for transport in three-dimensional discrete fracture networks. *Computational Geosciences*, 19(5), 1123–1137.

All source files of C code of dfnTrans are in ParticleTracking/ directory of dfnWorks 2.0. It compiles under linux/mac machines using makefile. In order to run transport, first, all the parameters and paths should be set up in the PTDFN Control file, PTDFN_control.dat. Then, the following command should be run:

```
./dfnTrans PTDFN_control.dat
```

The control file sets all necessary parameters to run particle tracking in dfnWorks. Below is one control file example that includes a short explanation of each parameter setting:

```

/*****
/*   CONTROL FILE FOR PARTICLE TRACKING IN DISCRETE FRACTURE NETWORK   */
*****/

// 1. Define paths of files that were generated by DFNGEN and contain all the
↳ information about computational grid.

/***** INPUT FILES: grid *****/
/**** input files with grid of DFN, mainly it's output of dfnGen *****/
param: params.txt //generated by dfnGen, contains the number of fractures in the DFN

poly: poly_info.dat //generated by dfnGen, contains the normal vectors of each
↳ polygon; used for rotation each fracture

inp: full_mesh.inp // AVS file of full mesh of DFN: positions of vertices and
↳ connectivity list

```

```

stor: tri_fracture.stor // produced by LaGriT: the matrix of all connected nearest_
↳ neighbors faces of Voronoi polygons and their geometrical coefficients

boundary: allboundaries.zone //list of nodes that located on domain boundaries
/* boundary conditions: reading the nodes that belong to in-flow and
out-flow boundaries. Should be consistent with those applied to obtain
steady state pressure solution (PFLOTTRAN) */
/*1 - top; 2 - bottom; 3 - left_w; 4 - front_s; 5 - right_e; 6 - back_n */
in-flow-boundary: 3
out-flow-boundary: 5

/* The allboundaries.dat file can be modified according to task. For example,
inflow boundaries are left and top, and out flow is a bottom face of the domain.
In this case, left and top list of boundary nodes should be combined together
in allboundaries.dat and only one number given (for example 1). dfnTrans code
can't read more than one defined number for in-flow or out-flow boundaries.
Also, number of boundary zone is not limited by 6. */

// 2. Input of Flow Solver results

/***** INPUT FILES: PFLOTTRAN flow solution *****/
PFLOTTRAN: yes //yes - the PFLOTTRAN flow solver is used

PFLOTTRAN_vel: darcyvel.dat // the Darcy flux for each Control Volume face of the full_
↳ mesh of DFN

PFLOTTRAN_cell: cellinfo.dat

/*connectivity list and area of each Control Volume face of the full mesh of DFN.

PYDFNWORKS: THE DFNWORKS PYTHON PACKAGE

The pydfnworks package allows the user to easily run dfnWorks from the command line and call dfnWorks within other python scripts. Because pydfnworks is a package, users can call individual methods from the package easily.

The pydfnworks must be setup by the user using the following command in the directory dfnWorks-Version2.0/pydfnworks/ :

```
python setup.py install (if the user has admin privileges), OR:
```

```
python setup.py install --user (if the user does not have admin privileges):
```

The documentation below includes all the methods and classes of the pydfnworks package.

5.1 Overall Workflow

```
pydfnworks.create_dfn(dfnGen_file='', dfnFlow_file='', dfnTrans_file='')  
    Parse command line inputs and input files to create and populate dfnworks class
```

5.2 dfnGen

5.2.1 Processing generator input

```
pydfnworks.gen_input.check_input(self, input_file='', output_file='')
```

Input Format Requirements:

- Each parameter must be defined on its own line (separate by newline)
- A parameter (key) MUST be separated from its value by a colon ':' (ie. -> key: value)
- Values may also be placed on lines after the 'key'
- Comment Format: On a line containing // or / *, nothing after * / or // will be processed but text before a comment will be processed

Kwargs:

- input_file (name): name of dfnGen input file
- output_file (name): stripped down input file for DFNGen

```
class pydfnworks.distributions.distr(params, numEdistrib, numRdistrib, minFracSize)  
    Verifies the fracture distribution input parameters for dfnGen.
```

Attributes:

- `params` (list): parameters for `dfnGen`
- `numEdistrib` (int): number of ellipse family distributions
- `numRdistrib` (int): number of rectangle family distributions
- `minFracSize` (double): minimum fracture size

beta_distribution (*prefix*)

Verifies both the “`ebetaDistribution`” and “`rBetaDistribution`”. If either contain any flags indicating constant angle (1) then the corresponding “`ebeta`” and/or “`rbeta`” parameters are also verified.

Args: `prefix` (str): Indicates shapes that the beta distribution describes. ‘e’ if they are ellipses, ‘r’ if they are rectangles.

constant_dist (*prefix*)

Verifies parameters for constant distribution of fractures

distr (*prefix*)

Verifies “`edistr`” and “`rdistr`” making sure one distribution is defined per family and each distribution is either 1 (log-normal), 2 (Truncated Power Law), 3 (Exponential), or 4 (constant). Stores how many of each distrib are in use in `numEdistrib` or `numRdistrib` lists.

exponential_dist (*prefix*)

Verifies parameters for exponential distribution of fractures.

lognormal_dist (*prefix*)

Verifies all logNormal Parameters for ellipses and Rectangles.

tpl_dist (*prefix*)

Verifies parameters for truncated power law distribution of fractures.

5.2.2 Running the generator

`pydfnworks.generator.create_network` (*self*)

Execute `dfnGen` and print whether the generation of the fracture network failed or succeeded. The `params.txt` file must be there for success.

`pydfnworks.generator.dfn_gen` (*self*)**Run the dfnGen workflow:**

1. `make_working_directory`: Create a directory with name of job
2. `check_input`: Check input parameters and create a clean version of the input file
3. `create_network`: Create network. `DFNGEN v2.0` is called and creates the network
4. `output_report`: Generate a PDF summary of the DFN generation
5. `mesh_network`: calls module `dfnGen_meshing` and runs `LaGriT` to mesh the DFN

`pydfnworks.generator.make_working_directory` (*self*)

make working directories for fracture generation

5.2.3 Graphing generator output

`pydfnworks.gen_output.output_report` (*self*, `radiiFile='radii.dat'`, `famFile='families.dat'`, `transFile='translations.dat'`, `rejectFile='rejections.dat'`, `output_name=''`)

Create PDF report of generator

Notes:

- Set the number of histogram buckets (bins) by changing numBuckets variable in his graphing functions
- Also change number of x-values used to plot lines by changing numXpoints variable in appropriate funcs
- Set show = True to show plots immediately and still make pdf
- NOTE future developers of this code should add functionality for radiiList of size 0.

5.3 dfnFlow

`pydfnworks.flow.dfn_flow(self)`

dfnFlow Run the dfnFlow portion of the workflow.

`pydfnworks.flow.inp2gmw(self, inp_file='')`

Convert inp file to gmw file, for general mesh viewer .

Kwargs: `inp_file` (str): name of inp file

`pydfnworks.flow.lagrit2pflotran(self, inp_file='', mesh_type='', hex2tet=False)`

Takes output from LaGriT and processes it for use in PFLOTTRAN.

Kwargs:

- `inp_file` (str): name of the inp (AVS) file produced by LaGriT
- `mesh_type` (str): the type of mesh
- `hex2tet` (boolean): True if hex mesh elements should be converted to tet elements, False otherwise.

`pydfnworks.flow.parse_pflotran_vtk(self, grid_vtk_file='')`

Using C++ VTK library, convert inp file to VTK file, then change name of CELL_DATA to POINT_DATA.

`pydfnworks.flow.parse_pflotran_vtk_python(self, grid_vtk_file='')`

Replace CELL_DATA with POINT_DATA in the VTK output.

`pydfnworks.flow.pflotran(self)`

Run pflotran Copy PFLOTTRAN run file into working directory and run with ncpus

`pydfnworks.flow.pflotran_cleanup(self)`

Concatenate PFLOTTRAN output files and then delete them

`pydfnworks.flow.write_perms_and_correct_volumes_areas(self, inp_file='', uge_file='', perm_file='', aper_file='')`

Write permeability values to perm_file, write aperture values to aper_file, and correct volume areas in uge_file

`pydfnworks.flow.zone2ex(self, uge_file='', zone_file='', face='')`

Convert zone files from LaGriT into ex format for LaGriT inputs: `uge_file`: name of uge file `zone_file`: name of zone file `face`: face of the plane corresponding to the zone file

`zone_file='all'` processes all directions, top, bottom, left, right, front, back

5.4 dfnTrans

`pydfnworks.transport.copy_dfn_trans_files(self)`

create link to DFNTRANS and copy input file into local directory

```
pydfnworks.transport.dfn_trans(self)
    dfnTrans Copy input files for dfnTrans into working directory and run DFNTrans

pydfnworks.transport.run_dfn_trans(self)
    run dfnTrans simulation
```

5.5 LaGriT (meshing)

5.5.1 Mesh DFN

```
pydfnworks.meshdfn.mesh_network(self, production_mode=True, refine_factor=1, slope=2)
    Mesh Fracture Network using ncpus and lagrit meshing file is separate file: dfnGen_meshing.py
```

5.5.2 LaGrit scripts

```
pydfnworks.lagrit_scripts.create_lagrit_scripts(visual_mode, ncpu, refine_factor=1,
                                                production_mode=True)
```

Creates LaGriT script to be run for each polygon

Inputs:

- visual_mode (True / False)
- ncpu: number of cpus
- refine_fractor: used rectangles
- production_mode (True/False)

```
pydfnworks.lagrit_scripts.create_merge_poly_files(ncpu, num_poly, h, visual_mode)
```

Section 4 [Create merge_poly file] Creates a lagrit script that reads in each mesh, appends it to the main mesh, and then deletes that mesh object Then duplicate points are removed from the main mesh using EPS_FILTER The points are compressed, and then written in the files full_mesh.gmv, full_mesh.inp, and an FEHM dump is preformed.

```
pydfnworks.lagrit_scripts.create_parameter_mgli_file(num_poly, h, slope=2, re-
                                                    fine_dist=0.5)
```

create parameter_mgli_files Outputs parameteri.mgli files used in running LaGriT Scripts

Inputs:

- num_poly: Number of polygons
- h: meshing length scale
- slope: Slope of coarsening function, default = 2, set to 0 for uniform mesh resolution
- refine_dist: distance used in coarsing function, default = 0.5,

```
pydfnworks.lagrit_scripts.create_user_functions()
```

Create user_function.lgi files for meshing

```
pydfnworks.lagrit_scripts.define_zones(h, domain)
```

Creates and runs LaGriT script to define domain size

5.5.3 Run meshing in parallel

`pydfnworks.run_meshing.merge_the_meshes` (*num_poly*, *ncpu*, *n_jobs*, *visual_mode*)

Merges all the meshes together, deletes duplicate points, dumps the .gmV and fehM files

`pydfnworks.run_meshing.mesh_fracture` (*fracture_id*, *visual_mode*, *num_poly*)

Child function for parallelized meshing of fractures

`pydfnworks.run_meshing.mesh_fractures_header` (*num_poly*, *ncpu*, *visual_mode*)

Header function for Parallel meshing of fractures

Creates a queue of fracture numbers ranging from 1, num_poly

Each fracture is meshed using mesh_fracture called within the worker function.

If any fracture fails to mesh properly, then a folder is created with that fracture information and the fracture number is written into failure.txt.

Returns:

- True: If failure.txt is empty meaning all fractures meshed correctly
- False: If failure.txt is not empty, then at least one fracture failed.

`pydfnworks.run_meshing.worker` (*work_queue*, *visual_mode*, *num_poly*)

Worker function for parallelized meshing

5.6 Helper methods

5.6.1 Mesh helper methods

`pydfnworks.mesh_dfn_helper.check_dudded_points` (*dudded*)

Parses Lagrit log_merge_all.txt and checks if number of dudded points is the expected number Returns: A

- True if the number of dudded points is correct
- False if the number of dudded points is incorrect

`pydfnworks.mesh_dfn_helper.cleanup_dir` ()

Removes files from meshing

`pydfnworks.mesh_dfn_helper.output_meshing_report` (*visual_mode*)

Prints information about the final mesh to file

`pydfnworks.mesh_dfn_helper.parse_params_file` ()

Reads params.txt file and parse information

Returns:

- num_poly: (int) Number of Polygons
- h: (float) meshing length scale h
- dudded_points: (int) Expected number of dudded points in Filter (LaGrIT)
- visual_mode: True/False
- domain: dict: x,y,z domain sizes

5.6.2 Print legal statement

`pydfnworks.legal.legal(self)`
Print the legal LANL statement for dfnWorks.

5.6.3 Other helper methods

`pydfnworks.helper.commandline_options()`
Read command lines for use in dfnWorks.

Options:

- `-name` : Jobname (Mandatory)
- `-ncpu` : Number of CPUS (Optional, default=4)
- `-input` : input file with paths to run files (Mandatory if the next three options are not specified)
- `-gen` : Generator Input File (Mandatory, can be included within this file)
- `-flow` : PFLORAN Input File (Mandatory, can be included within this file)
- `-trans` : Transport Input File (Mandatory, can be included within this file)
- `-cell` : True/False Set True for use with cell based aperture and permeability (Optional, default=False)

`pydfnworks.helper.dump_time(local_jobname, section_name, time)`
keeps log of cpu run time, current formulation is not robust

`pydfnworks.helper.get_num_frac()`
Get the number of fractures from the params.txt file.

class `pydfnworks.helper.input_helper(params, minFracSize)`
Functions to help parse the input file and check input parameters.

Attributes:

- `params` (list): list of parameters specified in the input file.
- `minFracSize` (float): the minimum fracture size.

check_fam_count ()
Makes sure at least one polygon family has been defined in nFamRect or nFamEll OR that there is a user input file for polygons.

check_mean (minParam, maxParam, meanParam, warningFile='')
Warns the user if the minimum value of a parameter is greater than the family's mean value, or if the maximum value of the parameter is less than the family's mean value.

check_min_frac_size (valList)
Corrects the minimum fracture size if necessary, by looking at the values in valList.

check_min_max (minParam, maxParam, shape)
Checks that the minimum parameter for a family is not greater or equal to the maximum parameter.

curly_to_list (curlyList)
'{1,2,3}' -> [1,2,3]

error (errString)
print an error

Args: errString (str): a string describing the error

extract_parameters (*line, inputIterator*)

Returns line without comments or white space.

find_key (*line, unfoundKeys, warningFile*)

Input: line containing a paramter (key) preceding a ":"

Returns:

- key – if it has not been defined yet and is valid
- None – if key does not exist
- exits – if the key has already been defined to prevent duplicate confusion

find_val (*line, key, inputIterator, unfoundKeys, warningFile*)

Extract the value for key from line.

get_groups (*line, valList, key*)

extract values between { and }

has_curlys (*line, key*)

Checks to see that every { has a matching }.

is_negative (*num*)

“returns True if num is negative, false otherwise

list_to_curly (*strList*)

[1,2,3] -> '{1,2,3}' for writing output

process_line (*line, unfoundKeys, inputIterator, warningFile*)

Find the key in a line, and the value for that key.

scale (*probList, warningFile*)

scales list of probabilities (famProb) that doesn't add up to 1 ie [.2, .2, .4] -> [0.25, 0.25, 0.5]

val_helper (*line, valList, key*)

pulls values from curly brackets

value_of (*key, writing=False*)

Use to get key's value in params. writing always false

verify_flag (*value, key='', inList=False*)

Verify that value is either a 0 or a 1.

verify_float (*value, key='', inList=False, noNeg=False*)

Verify that value is a positive float.

verify_int (*value, key='', inList=False, noNeg=False*)

Verify that value is a positive integer.

verify_list (*valList, key, verificationFn, desiredLength, noZeros=False, noNegs=False*)

verifies input list that come in format {0, 1, 2, 3}

Input:

- valList - list of values (flags, floats, or ints) corresponding to a parameter
- key - the name of the parameter whose list is being verified
- verificationFn - (either verifyflag, verifyfloat or verifyint) checks each list element
- desiredLength - how many elements are supposed to be in the list
- noZeros - (optional) True for lists than cannot contain 0's, false if 0's are ok
- noNegs - (optional) True for lists than cannot contain negative numbers, false otherwise

Output:

- returns negative value of list length to indicate incorrect length and provide meaningful error message
- prints error and exits if a value of the wrong type is found in the list
- returns None if successful

warning (*warnString*, *warningFile*='')

print a warning to a file (currently does not work)

zero_in_std_devs (*valList*)

returns True if there is a zero in *valList* of standard deviations

`pydfnworks.helper.print_run_time` (*local_jobname*)

Read in run times from file and print to screen with percentages

SCRIPTS

The pydfnworks package has four Python scripts that assist with compiling, testing, and running the software. These scripts are all in the folder `dfnWorks-Version2.0/pydfnworks/bin/`.

6.1 fix_paths.py: fix the paths in the tests folder

The tests that come with dfnWorks depend on pathnames which vary depending on where dfnWorks is installed. To fix these paths automatically, run the “fix_paths.py” script accordingly:

```
python fix_paths.py
```

6.2 compile.py: compile dfnWorks components

The `compile.py` script is called by `run.py`, but can also be called on its own. This script compiles the C and C++ components of dfnWorks. Without arguments, the script performs the compiling. With the argument ‘clean,’ the script cleans up C and C++ object files, before compiling.

6.3 test.py: test dfnWorks

The `test.py` script can be used to easily test functionality of dfnWorks. It runs a test suite (input files contained in the tests folder) that test the exponential, power law, and lognormal distributions as well as user-defined ellipses and user-defined rectangle fracture inputs. The syntax is:

```
python test.py [TEST_NAME_PART]
```

Here `[TEST_NAME_PART]` is all or part of the name of the tests the user wants to run.

6.4 run.py: run dfnWorks

The `run.py` script allows the user to execute a single run of dfnWorks. The syntax for this script is:

```
python run.py -name [JOBNAME] -input [INPUT_FILE_NAME] -ncpu [NUMBER OF CPUS  
TO USE]
```

Please refer to the tutorial section (the next section for a detailed description of how to run dfnWorks.

OUTPUT FILES

dfnWorks outputs about a hundred different output files. This section describes the contents and purpose of each file.

7.1 File locations

Here is a list of file locations after dfnWorks has finished running:

7.1.1 dfnWorks-main

- *allboundaries.zone*
- *aperture.dat*
- *cellinfo.dat*
- *darcyvel.dat*
- *dfnTrans_output_dir*
- *params.txt*
- *PTDFN_control.dat*
- *pboundary_back_n.zone*
- *pboundary_bottom.zone*
- *pboundary_front_s.zone*
- *pboundary_left_w.zone*
- *pboundary_right_e.zone*
- *pboundary_top.zone*

7.1.2 dfnGen

- *connectivity.dat*
- *DFN_output.txt*
- *families.dat*
- *input_generator.dat*
- *input_generator_clean.dat*

- *normal_vectors.dat*
- *radii*
- *radii.dat*
- *radii_Final.dat*
- *rejections.dat*
- *rejectsPerAttempt.dat*
- *translations.dat*
- *triple_points.dat*
- *user_rects.dat*
- *warningFileDFNGen.txt*

7.1.3 LaGriT

- *bound_zones.lgi*
- *boundary_output.txt*
- *finalmesh.txt*
- *full_mesh.inp*
- *full_mesh.gmv*
- *full_mesh.lg*
- *intersections*
- *lagrit_logs*
- *logx3dgen*
- *outx3dgen*
- *parameters*
- *polys*
- *tri_fracture.stor*
- *user_function.lgi*

7.1.4 PFLOTTRAN

- *aperture.dat*
- *cellinfo.dat*
- *dfn_explicit-000.vtk*
- *dfn_explicit-001.vtk*
- *dfn_explicit-mas.dat*
- *dfn_explicit.in*
- *dfn_explicit.out*
- *dfn_properties.h5*

- *full_mesh.uge*
- *full_mesh_viz.inp*
- *full_mesh_vol_area.uge*
- *materialid.dat*
- *parsed_vtk*
- *perm.dat*
- *pboundary_back_n.ex*
- *pboundary_bottom.ex*
- *pboundary_front_s.ex*
- *pboundary_left_w.ex*
- *pboundary_right_e.ex*
- *pboundary_top.ex*

7.2 dfnGen

connectivity.dat: Fracture connection list. Each row corresponds to a single fracture. The integers in that row are the fractures that fracture intersects with. These are the non-zero elements of the adjacency matrix.

convert_uge_params.txt: Input file do conver_uge executable.

DFN_output.txt: Detailed information about fracture network. Output by DFNGen.

families.dat: Information about fracture families. Produced by DFNGen.

input_generator.dat: Input file for DFN generator.

input_generator_clean.dat: Abbreviated input file for DFN generator.

normal_vectors.dat: Normal vector of each fracture in the network.

poly_info.dat: Fracture information output by DFNGen. Format: Fracture Number, Family number, rotation angle for rotateIn in LaGriT, x0, y0, z0, x1, y1, z1 (end points of line of rotation).

user_rects.dat: User defined rectangle file.

radii: Subdirectory containing fracture radii information.

radii.dat: Concatentate file of fracture radii. Contains fractures that are removed due to isolation.

radii_Final.dat: Concatentated file of final radii in the DFN.

rejections.dat: Summary of rejection reasons.

rejectsPerAttempt.dat: Number of rejections per attempted fracture.

translations.dat: Fracture centriods.

triple_points.dat: x,y,z location of triple intersection points.

warningFileDFNGen.txt: Warning file output by DFNGen.

7.3 LaGrit

bound_zones.lgi: LaGriT run file to identify boundary nodes. Dumps zone files.

boundary_output.txt: Output file from bound_zones.lgi.

finalmesh.txt: Brief summary of final mesh.

full_mesh.inp: Full DFN mesh in AVS format.

full_mesh.gmv: Full DFN mesh in GMV (general mesh viewer) format.

full_mesh.lg: Information: Full DFN mesh in LaGriT binary format.

intersections: Directory containing intersection avs files output by the generator and used by LaGrit.

lagrit_logs: Directory of output files from individual meshing.

logx3dgen: LaGriT output.

outx3dgen: LaGriT output.

parameters: Directory of parameter*.mgli files used for fracture meshing.

params.txt: Parameter information about the fracture network used for meshing. Includes number of fractures, h, visualmode, expected number of dudded points, and x,y,z dimensions of the domain.

polys: Subdirectory containing AVS file for polygon boundaries.

tri_fracture.stor: FEHM stor file. Information about cell volume and area.

user_function.lgi: Function used by LaGriT for meshing. Defines coarsening gradient.

7.4 PFLOTTRAN

aperture.dat: Fracture based aperture value for the DFN. Used to rescale volumes in full_mesh_vol_area.uge.

cellinfo.dat: Mesh information output by PFLOTTRAN.

dfn_explicit-000.vtk: VTK file of initial conditions of PFLOTTRAN. Mesh is not included in this file.

dfn_explicit-001.vtk: VTK file of steady-state solution of PFLOTTRAN. Mesh is not included in this file.

dfn_explicit-mas.dat: pflotran information file.

dfn_explicit.in: pflotran input file.

_dfn_explicit.out: pflotran output file.

dfn_properties.h5: h5 file of fracture network properties, permeability, used by pflotran.

full_mesh.uge: Full DFN mesh in UGE format. NOTE volumes are not correct in this file. This file is processed by convert_uge to create full_mesh_vol_area.uge, which has the correct volumes.

full_mesh_viz.inp: Full DFN mesh with limited attributes in AVS format.

full_mesh_vol_area.uge: Full DFN in uge format. Volumes and areas have been corrected.

materialid.dat: Material ID (Fracture Number) for every node in the mesh.

parsed_vtk: Directory of pflotran results.

perm.dat: Fracture permeabilities in FEHM format. Each fracture is listed as a zone, starting index at 7.

pboundary_back_n.ex: Boundary file for back of the domain used by PFLOTTRAN.

pboundary_bottom.ex: Boundary file for bottom of the domain used by PFLOTTRAN.

pboundary_front_s.ex: Boundary file for front of the domain used by PFLOTTRAN.

pboundary_left_w.ex: Boundary file for left side of the domain used by PFLOTTRAN.

pboundary_right_e.ex: Boundary file for right of the domain used by PFLOTTRAN.

pboundary_top.ex: Boundary file for top of the domain used by PFLOTTRAN.

7.5 dfnTrans

allboundaries.zone: Concatenated file of all zone files.

darcyvel.dat: Concatenated file of darcy velocities output by PFLOTTRAN.

dfnTrans_output_dir: Output directory from DFNTrans. Particle travel times, trajectories, and reconstructed Velocities are in this directory.

PTDFN_control.dat: Input file for DFNTrans.

pboundary_back_n.zone: Boundary zone file for the back of the domain.

pboundary_bottom.zone: Boundary zone file for the bottom of the domain.

pboundary_front_s.zone: Boundary zone file for the front of the domain.

pboundary_left_w.zone: Boundary zone file for the left side of the domain.

pboundary_right_e.zone: Boundary zone file for the bottom of the domain.

pboundary_top.zone: Boundary zone file for the top of the domain.

TUTORIAL

This document contains a short, five example, tutorial for dfnWorks. The five test cases provided are for:

- `4_user_defined_rectangles`: The user defines the precise location and size of four rectangular fractures.
- `4_user_defined_ellipses`: The user defines the precise location and size of four elliptical fractures, where the ellipses are approximated as polygons.
- `exponential_dist`: The user specifies the parameters for two families of fractures with an exponential distribution of fracture size.
- `lognormal_dist`: The user specifies the parameters for two families of fractures with a lognormal distribution of fracture size.
- `truncated_power_law_dist`: The user specifies the parameters for two families of fractures with a truncated power-law distribution of fracture size.

All required input files for these examples are contained in the folder `dfnWorks-Version2.0/tests/`. The focus of this document is to provide visual confirmation that new users of dfnWorks have the code set up correctly, can carry out the following runs and reproduce the following images. All images are rendered using Paraview, which can be obtained for free at [http : //www.paraview.org/](http://www.paraview.org/). The first two examples are simpler than the last three so it is recommended that the user proceed in the order presented here.

8.1 Turn on X forwarding if on server

Ensure that X forwarding is turned on if you are running dfnWorks from an ssh connection. This requires that the ssh login have the `-X` option:

```
$ ssh -X SERVER_NAME
```

8.2 Go to the dfnWorks-Version2.0 repository

```
$ cd ~/dfnWorks-Version2.0/
```

8.3 Fix paths in test directory

Fix the pathnames for all files in the folder `/tests/`. This can be done automatically by running the script `fix_paths.py`:

```
$ cd /pydfnworks/bin/  
$ python fix_paths.py
```

8.4 Set the PETSC, PFLOTRAN, Python, and LaGriT paths correctly

Before executing dfnWorks, the following paths must be set:

- dfnWorks_PATH: the dfnWorks-Version2.0 repository folder
- PETSC_DIR and PETSC_ARCH: PETSC environmental variables
- PFLOTRAN_DIR: The PFLOTRAN directory
- python_dfn: The location of the Python distribution to use
- lagrit_dfn: The location of the LaGriT executable

```
$ vi /pydfnworks/pydfnworks/paths.py
```

For example:

```
os.environ['dfnWorks_PATH'] = '/home/nknapp/dfnWorks-Version2.0/'
```

8.5 Setup the Python package pydfnworks

Go up a directory:

```
$ cd ..
```

If the user has admin privileges:

```
$ python setup.py install
```

If the user DOES NOT have admin privileges:

```
$ python setup.py install --user
```

8.6 Executing dfnWorks

To run one of the test cases enter the following command:

```
$ python run.py -name [JOBNAME] -input [INPUT_FILE] -ncpu [NUMBER_OF_CPUS]
```

The arguments are:

- [JOBNAME]: The name of the run, which is also the absolute path name of the folder which will contain the run's output.
- [INPUT_FILE]: An input file with three lines that have input files for dfnGen, dfnFlow, and dfnTrans, respectively. Any of the files with ending .txt in the directory tests can be used as examples of input files.
- [NUMBER_OF_CPUS]: The number of CPUs that the user would like to use for the parallel computation of the meshing and flow solutions.

For example, to run the 4_user_defined_rectangles test below, on 4 CPUs, the command line input would be:

```
$ cd bin
$ python run.py -name /home/nknapp/4_user_defined_rectangles
  -input /home/nknapp/dfnWorks-Version2.0/tests/4_user_defined_rectangles.txt
  -ncpu 4
```

This command will run the 4_user_defined_rectangles test and create a new folder 4_user_defined_rectangles where all output files will be located. Descriptions of each output file are in the documentation. In the following sections, we provide descriptions of the output you should expect for each of the five examples.

8.7 Summary

Here is a quick summary of the steps described above, with commands for the 4_user_defined_rectangles test case. **You MUST edit the paths in paths.py, and change ~ to the location of the repository, for these commands to work! Also, note that the last command should be on one line.**

```
$ ssh -X SERVER_NAME
$ cd ~/dfnWorks-Version2.0/pydfnworks/bin/
$ python fix_paths.py
$ vi /pydfnworks/pydfnworks/paths.py
$ cd ..
$ python setup.py install --user
$ cd bin
$ python run.py -name /home/nknapp/4_user_defined_rectangles
  -input /home/nknapp/dfnWorks-Version2.0/tests/4_user_defined_rectangles.txt
  -ncpu 4
```

8.8 4_user_defined_rectangles

This test case consists of four user defined rectangular fractures within a cubic domain with sides of length one meter. The input file specifying the ellipses is in dfnWorks-Version2.0/tests, and is named define_4_user_rectangles.dat. To run the test on 4 cpus, enter the following command line input:

The network of four fractures, each colored by material ID. The computational mesh is overlaid on the fractures. This image is created by loading the file full_mesh.inp. located in the folder 4_user_defined_rectangles/LaGriT/, into Paraview.

High pressure (red) Dirichlet boundary conditions are applied on the edge of the single fracture along the boundary $x = -0.5$, and low pressure (blue) boundary conditions are applied on the edges of the two fractures at the boundary $x = 0.5$. This image is created by loading the file 4_user_defined_rectangles/PFLOTRAN/parsed_vtk/dfn_explicit-001.vtk into Paraview.

Particles are inserted uniformly along the inlet fracture on the left side of the image. Particles exit the domain through the two horizontal fractures on the right side of the image. Due to the stochastic nature of the particle tracking algorithm, your pathlines might not be exactly the same as in this image. Trajectories are colored by the current velocity magnitude of the particle's velocity. Trajectories can be visualized by loading the files part_*.inp, in the folder 4_user_rectangles/dfnTrans/trajectories/. We have used the extract surface and tube filters in paraview for visual clarity.

In the other tests, only a brief description and pictures are provided.

Fig. 8.1: *The meshed network of four fractures.*

Fig. 8.2: *The network of four fractures, colored by pressure solution.*

Fig. 8.3: Particle trajectories on the network of four fractures.

8.9 4_user_defined_ellipses

This test case consists of four user defined elliptical fractures within a cubic domain with sides of length one meter. In this case the ellipses are approximated using 5 vertices. The input file specifying the ellipses is in dfnWorks-Version2.0/tests, and is named define_4_user_ellipses.dat.

8.10 truncated_power_law_dist

This test case consists of two families whose sizes have a truncated power law distribution with a minimum size of 0.5m and a maximum size of 50m. The domain size is cubic with an edge length of 4m. The other input parameters can be found in `tests/gen_truncated_power_law_dist.dat`.

8.11 exponential_dist

This test case consists of a family of fractures whose size is exponentially distributed with a minimum size of 1m and a maximum size of 50m. The domain is cubic with an edge length of 10m. All input parameters for the generator can be found in tests/gen_exponential_dist.dat.

8.12 lognormal_dist

This test case consists of two fracture families whose sizes have a lognormal distribution with a minimum size of 0.5m and a maximum size of 50m. The domain size is cubic with an edge length of 10m. All input parameters for the generator can be found in tests/gen_lognormal_dist.dat.

EXAMPLE APPLICATIONS

9.1 Carbon dioxide sequestration

dfnWorks provides the framework necessary to perform multiphase simulations (such as flow and reactive transport) at the reservoir scale. A particular application, highlighted here, is sequestering CO₂ from anthropogenic sources and disposing it in geological formations such as deep saline aquifers and abandoned oil fields. Geological CO₂ sequestration is one of the principal methods under consideration to reduce carbon footprint in the atmosphere due to fossil fuels (Bachu, 2002; Pacala and Socolow, 2004). For safe and sustainable long-term storage of CO₂ and to prevent leaks through existing faults and fractured rock (along with the ones created during the injection process), understanding the complex physical and chemical interactions between CO₂, water (or brine) and fractured rock, is vital. dfnWorks capability to study multiphase flow in a DFN can be used to study potential CO₂ migration through cap-rock, a potential risk associated with proposed subsurface storage of CO₂ in saline aquifers or depleted reservoirs. Moreover, using the reactive transport capabilities of PFLOTRAN coupled with cell-based transmissivity of the DFN allows one to study dynamically changing permeability fields with mineral precipitation and dissolution due to CO₂–water interaction with rock.

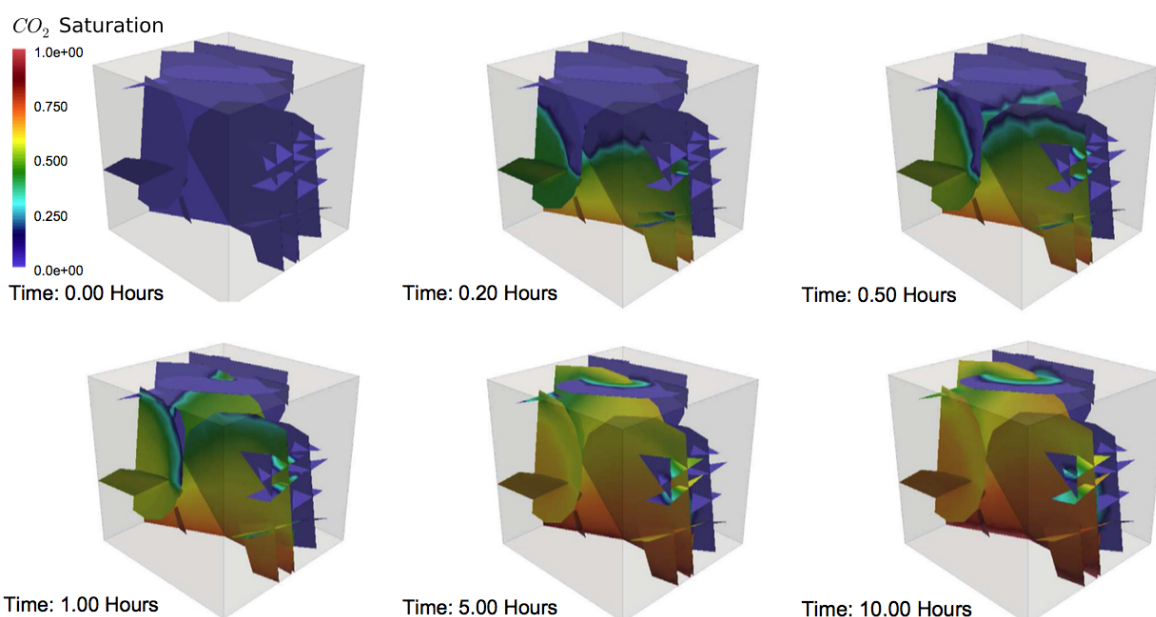

Fig. 9.1: Temporal evolution of supercritical CO₂ displacing water in a meter cube DFN containing 24 fractures. The DFN is initially fully saturated with water, (top left time 0 hours) and supercritical CO₂ is slowly injected into the system from the bottom of the domain to displace the water for a total time of 10 h. There is an initial flush through the system during the first hour of the simulation, and then the rate of displacement decreases.

9.2 Shale energy extraction

Hydraulic fracturing (fracking) has provided access to hydrocarbon trapped in low-permeability media, such as tight shales. The process involves injecting water at high pressures to reactivate existing fractures and also create new fractures to increase permeability of the shale allowing hydrocarbons to be extracted. However, the fundamental physics of why fracking works and its long term ramifications are not well understood. Karra et al. (2015) used dfnWorks to generate a typical production site and simulate production. Using this physics based model, they found good agreement with production field data and determined what physical mechanisms control the decline in the production curve.

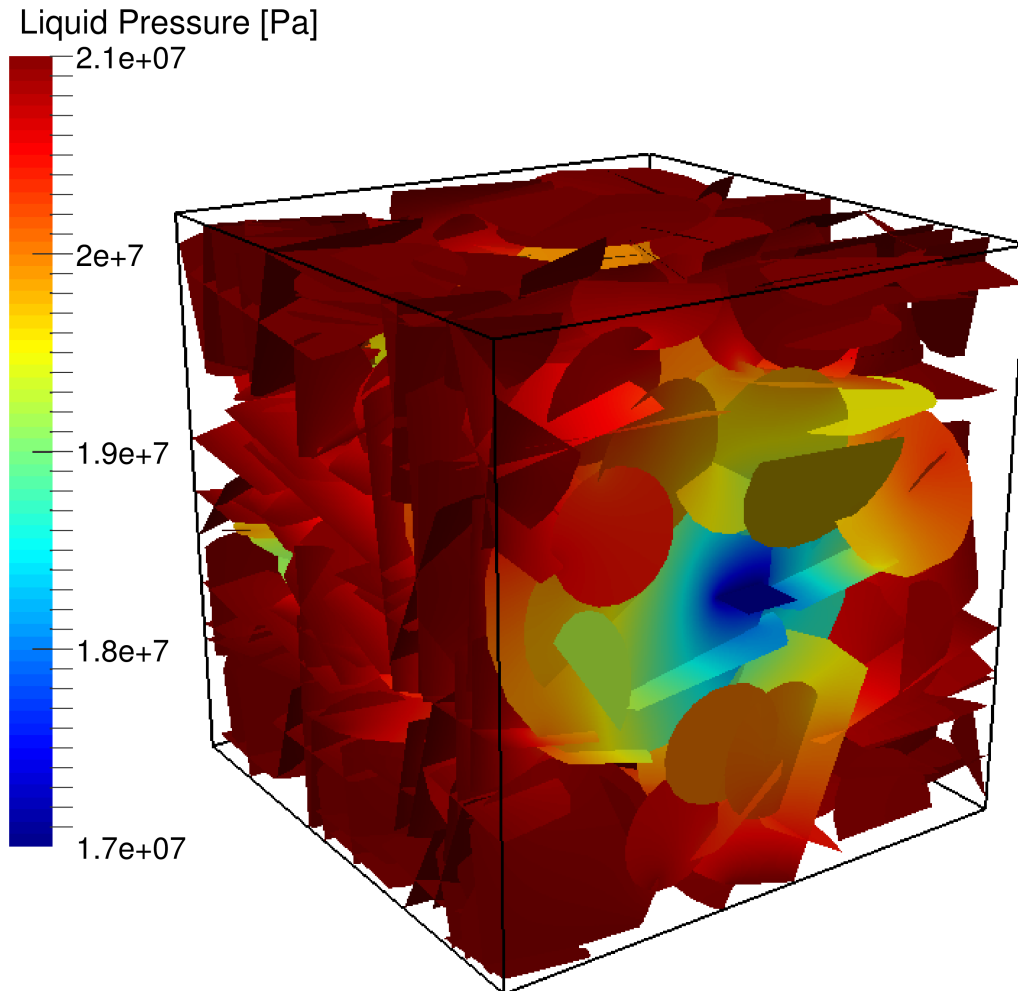

Fig. 9.2: Pressure in a well used for hydraulic fracturing.

9.3 Nuclear waste repository

The Swedish Nuclear Fuel and Waste Management Company (SKB) has undertaken a detailed investigation of the fractured granite at the Forsmark, Sweden site as a potential host formation for a subsurface repository for spent

nuclear fuel (SKB, 2011; Hartley and Joyce, 2013). The Forsmark area is about 120 km north of Stockholm in northern Uppland, and the repository is proposed to be constructed in crystalline bedrock at a depth of approximately 500 m. Based on the SKB site investigation, a statistical fracture model with multiple fracture sets was developed; detailed parameters of the Forsmark site model are in SKB (2011). We adopt a subset of the model that consist of three sets of background (non-deterministic) circular fractures whose orientations follow a Fisher distribution, fracture radii are sampled from a truncated power-law distribution, the transmissivity of the fractures is estimated using a power-law model based on the fracture radius, and the fracture aperture is related to the fracture size using the cubic law (Adler et al., 2012). Under such a formulation, the fracture apertures are uniform on each fracture, but vary among fractures. The network is generated in a cubic domain with sides of length one-kilometer. Dirichlet boundary conditions are imposed on the top (1 MPa) and bottom (2 MPa) of the domain to create a pressure gradient aligned with the vertical axis, and noflow boundary conditions are enforced along lateral boundaries.

Fig. 9.3: *Simulated particle trajectories in fractured granite at Forsmark, Sweden.*
